

1.25G Bi-Directional SFP Transceiver MBPD-2435S2-C-20

Features:

- 1310nm/1550nm single fiber bi-directional transmission
- Multi-Sourced SFP package with LC receptacle connector
- Operating bit rate 1.25Gbps
- Single +3.3V Power Supply
- Differential LVPECL inputs and outputs
- LVTTL signal detect indicator
- Hot-pluggable capability

Application:

FTTx

Description:

The MBPD-2435S2-C-20 series transceiver is high performance, cost effective module that supports data-rate of 1.25Gbps and transmission distance up to 10km.

As a transceiver, the transmitter section and the receiver section works individually in the module, the module features single mode single fiber bi-directional transmission obtained by an integrated WDM optical divice. All these modules are supplied in the MSA (multi-source agreement) compliant SFP style package with a single LC receptacle connector.

The main application area of this module is optical data transmission system such as the P2P (Point-to-Point) FTTx optical access network.

Specification:

| Operating Information | | | | | | |
|-----------------------|--------------|---------------|---------|-------------|--|--|
| Part Number | Input/Output | Signal Detect | Voltage | Temperature | | |
| MBPD-2435S2- | AC/AC | TTL | +3.3V | 0℃ to70℃ | | |

Block Diagram Of Transceiver:

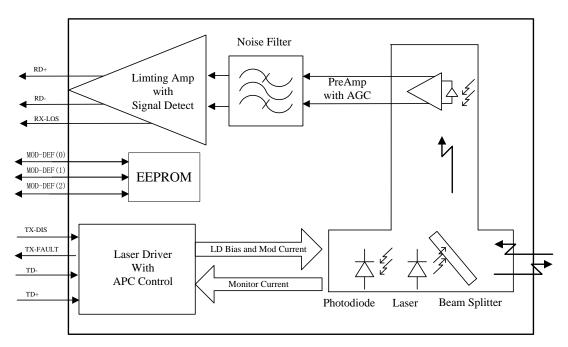

Figure2

Transmitter Section

TX-FAULT

The TTL level TX Fault is an open collector/drain output, which should be pulled up with a $4.7K - 10K\Omega$ resistor on the host board. to VccT. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

When sensing an improper power level in the laser driver, the SFP sets this signal high and turns off the laser. TX-FAULT can be reset with the TX-DISABLE line.

TX-DISABLE

TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a $4.7 - 10 \text{ K}\Omega$ resistor. The states are:

Low (0 - 0.8V): Transmitter on;

(>0.8, < 2.0V): Undefined;

High (>2.0): Transmitter Disabled;

Open: Transmitter Disabled.

Make TX-DISABLE high (TTL logic "1") to turn off the laser output. The laser will turn on when TX-DISABLE is low (TTL logic "0").

TD-/+

TD-/+ is AC-coupled 100 Ω differential transmitter inputs. These inputs will accept differential swings of 500 –1600 mV (250 –800 mV single-ended).

Receiver Section

RX-LOS

The TTL level RX-LOS signal is an open collector/drain output, which should be pulled up with a $4.7K - 10K\Omega$ resistor to VccR. When high, this output indicates the received optical power is below the worst-case receiver sensitivity level. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V.

RD-/+

RD-/+ are AC coupled 100Ω differential outputs which should be terminated with $100~\Omega$ (differentially) at the user SERDES. The AC coupling is done inside the module and is thus not required on the host board. The voltage swing on these lines will be between 400 and 1600 mV differential (200 – 800 mV single ended) when properly terminated.

Recommended Interface Circuit:
